

Based on the principles of responsible AI, the following considerations guided the development of the AI agent. To ensure that the project aligned with industry-standard ethics, we adhered to the following core principles: beneficence, nonmaleficence, autonomy, justice, and explicability. The agent is designed for beneficence by providing accurate salary bands that help HR professionals make informed, competitive offers. We ensured that the AI does not produce harmful hallucinations or errors which could lead to confusion and potential misclassifications of salary bands for these HR professionals. Autonomy is preserved by ensuring that HR maintains meaningful control; the AI provides decision support through options rather than final, unchangeable mandates. The model is designed to be fair and avoid any biases. AI models trained on real-world data can inadvertently encode and perpetuate societal biases. We actively audited the model to mitigate both representational harm, which involves negative shifts in how specific groups are portrayed, and allocational harm, which is the inequitable distribution of resources or opportunities, such as biased salary band assignments to ensure this fairness. And finally, the system must be transparent, allowing stakeholders to understand why a specific salary/job was chosen. To maintain trust, the AI agent's logic must be interpretable. By doing so, the user understands the model's potential limitations and what its intended use is. Beyond the ethics principles, a primary concern for this project is the protection of personal information. While building the AI agent, we ensured that no personal salary data or sensitive identifiers are included in the training or inference stages. By using technical safeguards together with Floridi's ethical framework, the agent is engineered to deliver high-utility salary classifications while upholding the highest standards of professional accountability and data integrity. This commitment ensures that the model serves as a reliable, unbiased partner in the HR decision-making process.
